

Dental Assessment

- **Mercury fillings (euphemistically silver fillings) outgas mercury and mercury is very damaging to the immune system**
- **Root canals are a source of toxins. Root canal teeth are dead and sometimes the immune system does not have the ability to handle the stress of these toxins upon the immune system.**
- **See *Root Canal Cover-up* by George Meinig DDS for a historical understanding of this problem and why it was not exposed.**
- **For example teeth #'s 2-5; 12-15; 20,21; 28,29 are frequently involved in breast cancer**
- **Cavitations – avascular necrosis which impact the meridians and produce waste products**
- **Galvanic currents in the mouth. The human body runs on electrical input and dissimilar materials in the mouth with saliva will act as a battery**
- **Size, location, and number of dental treatments is important**
- **Electrodermal screening (EDS) is important to assess relevance**
- **Biologic dentist most helpful**

I began treatments to remove my mercury fillings in 8/99 and was done by 12/99.

My energy levels are much improved. My mental abilities are improved. I have more memory, clarity, and improved cognitive reasoning skills.

In the past 13 months, I have been focusing on healing my body and spirit after my treatments from breast cancer.

If I were to tell “my story” to a group of cancer patients and offer a check list of essential steps to heal themselves, removing heavy metals (mercury) would be top on the list.
