

Water

- **Our bodies are approximately 75% water**
- **Most water is acidic, whether from a municipal tap, RO, or bottled. This is not desirable if the body is already in an acidic state.**
- **Otto Warburg won the Nobel Prize in 1931 on the metabolism of tumors showing that cancers grow in an acidic environment.**
- **Acidic water has a positive charge characteristic that promotes free radicals within the body and thus the “rusting” or aging that occur with free radicals. The over abundance of free radicals can lead to a cancer producing environment within the body.**
- **Water associates with itself in clusters. Any water with large clustering is more difficult to get into cells through the water entrances called “aquaporins”. The smaller the clusters, the more effective at gaining entrance into the cells and hydrating the cell interiors.**
- **Ionizing water machines produce an alkaline, negative ORP (good for quenching free radicals), small micro clustered water molecules. All of these factors are beneficial in cancer prevention and treatment.**
- **Hiromi Shinya MD at Albert Einstein in NYC is the co-developer of the colonoscopy. He has performed more than 140,00 polypectomies and is a firm believer in ionized water. All of his patients are put on a high alkaline diet with a minimum of one gallon of ionized water. There has been a zero recurrence of any kind of cancer in his patient base.**
